Package 'Strategus'

March 29, 2023

Type Package

Title Coordinating and Executing Analytics Using HADES Modules

Version 0.0.4

Date 2023-03-29

Maintainer Anthony Sena <sena@ohdsi.org>

Description An R package for coordinating and executing analytics using HADES modules.

License Apache License 2.0

R topics documented:

`addModuleSpecifications` *Add module specifications to analysis specifications*

Description

Add module specifications to analysis specifications

Usage

```
addModuleSpecifications(analysisSpecifications, moduleSpecifications)
```

Arguments

`analysisSpecifications`
: An object of type `AnalysisSpecifications` as created by `createEmptyAnalysisSpecificiations`

`moduleSpecifications`
: An object of type `ModuleSpecifications`.

Value

Returns the `analysisSpecifications` object with the module specifications added.

addSharedResources *Add shared resources to analysis specifications*

Description

Add shared resources to analysis specifications

Usage

```
addSharedResources(analysisSpecifications, sharedResources)
```

Arguments

analysisSpecifications	An object of type AnalysisSpecifications as created by createEmptyAnalysisSpecificiations
sharedResources	An object of type SharedResources.

Value

Returns the analysisSpecifications object with the module specifications added.

createCdmExecutionSettings *Create CDM execution settings*

Description

Create CDM execution settings

Usage

```
createCdmExecutionSettings(
  connectionDetailsReference,
  workDatabaseSchema,
  cdmDatabaseSchema,
  cohortTableNames = CohortGenerator::getCohortTableNames(cohortTable = "cohort"),
  workFolder,
  resultsFolder,
  minCellCount = 5
)
```

Arguments

connectionDetailsReference	A string that can be used to retrieve database connection details from a secure local store.

workDatabaseSchema
: A database schema where intermediate data can be stored. The user (as identified in the connection details) will need to have write access to this database schema.

cdmDatabaseSchema
: The database schema containing the data in CDM format. The user (as identified in the connection details) will need to have read access to this database schema.

cohortTableNames
: An object identifying the various cohort table names that will be created in the workDatabaseSchema. This object can be created using the CohortGenerator::getCohortTableNa function.

workFolder
: A folder in the local file system where intermediate results can be written.

resultsFolder
: A folder in the local file system where the module output will be written.

minCellCount
: The minimum number of subjects contributing to a count before it can be included in results.

Value

An object of type ExecutionSettings.

---

createEmptyAnalysisSpecificiations *Create an empty analysis specifications object.*

Description

Create an empty analysis specifications object.

Usage

```
createEmptyAnalysisSpecificiations()
```

Value

An object of type AnalysisSpecifications.

---

createResultsExecutionSettings *Create Results execution settings*

Description

Create Results execution settings

Usage

```
createResultsExecutionSettings(
  resultsConnectionDetailsReference,
  resultsDatabaseSchema,
  workFolder,
  resultsFolder,
  minCellCount = 5
)
```

Arguments

resultsConnectionDetailsReference	A string that can be used to retrieve the results database connection details from a secure local store.
resultsDatabaseSchema	A schema where the results tables are stored
workFolder	A folder in the local file system where intermediate results can be written.
resultsFolder	A folder in the local file system where the module output will be written.
minCellCount	The minimum number of subjects contributing to a count before it can be included in results.

Value

An object of type ExecutionSettings.

---

ensureAllModulesInstantiated

Ensure all modules are instantiated

Description

Ensure that all modules referenced in the analysis specifications are instantiated locally in the folder specified in the INSTANTIATED_MODULES_FOLDER environmental variable.

Missing modules will be fetched from remote repositories.

This function will also check whether there are different versions of the same module specified, which is not allowed, and whether all modules required by the specified modules are also instantiated.

Usage

```
ensureAllModulesInstantiated(analysisSpecifications)
```

Arguments

analysisSpecifications	An object of type AnalysisSpecifications as created by createEmptyAnalysisSpecificiations

Value

A tibble listing the instantiated modules.

execute *Execute analysis specifications.*

Description

Execute analysis specifications.

Usage

```
execute(
  analysisSpecifications,
  executionSettings,
  executionScriptFolder = NULL,
  keyringName = NULL,
  restart = FALSE
)
```

Arguments

analysisSpecifications	An object of type AnalysisSpecifications as created by createEmptyAnalysisSpecificiations
executionSettings	An object of type ExecutionSettings as created by createCdmExecutionSettings() or createResultsExecutionSettings().
executionScriptFolder	Optional: the path to use for storing the execution script. when NULL, this function will use a temporary file location to create the script to execute.
keyringName	The name of the keyring to operate on. This function assumes you have created the keyring before calling this function. It defaults to NULL to select the default keyring. If the keyring is password protected, the password must be stored in the environment variable STRATEGUS_KEYRING_PASSWORD so it is retrieved using the command Sys.getenv("STRATEGUS_KEYRING_PASSWORD")
restart	Restart run? Requires executionScriptFolder to be specified, and be the same as the executionScriptFolder used in the run to restart.

Value

Does not return anything. Is called for the side-effect of executing the specified analyses.

getModuleList *Provides a list of HADES modules to run through Strategus*

Description

This function provides a list of modules and their locations that may be used with Strategus.

Usage

```
getModuleList()
```

Value

A data.frame() of modules that work with Strategus. This will contain: module = The name of the module version = The version of the module remote_repo = The remote location of the module (i.e. github.com) remote_username = The organization of the module (i.e. OHDSI) module_type = 'cdm' or 'results'. 'cdm' refers to modules that are designed to work against patient level data in the OMOP CDM format. 'results' refers to modules that are designed to work against a results database containing output from a 'cdm' module.

---

retrieveConnectionDetails

Retrieve connection details from the secure location

Description

Retrieve connection details from the secure location

Usage

```
retrieveConnectionDetails(connectionDetailsReference, keyringName = NULL)
```

Arguments

connectionDetailsReference	A string that can be used to retrieve the settings from the secure store.
keyringName	The name of the keyring to operate on. This function assumes you have created the keyring before calling this function. It defaults to NULL to select the default keyring. If the keyring is password protected, the password must be stored in the environment variable STRATEGUS_KEYRING_PASSWORD so it is retrieved using the command Sys.getenv("STRATEGUS_KEYRING_PASSWORD")

Value

Returns an object of type connectionDetails.

See Also

storeConnectionDetails()

---

storeConnectionDetails

Store connection details in a secure location

Description

Store connection details in a secure location

Usage

```
storeConnectionDetails(
  connectionDetails,
  connectionDetailsReference,
  keyringName = NULL
)
```

Arguments

connectionDetails	An object of type connectionDetails as created by the DatabaseConnector::createConnectionD function.
connectionDetailsReference	A string that can be used to retrieve the settings from the secure store.
keyringName	The name of the keyring to operate on. This function assumes you have created the keyring before calling this function. It defaults to NULL to select the default keyring. If the keyring is password protected, the password must be stored in the environment variable STRATEGUS_KEYRING_PASSWORD so it is retrieved using the command Sys.getenv("STRATEGUS_KEYRING_PASSWORD")

Value

Does not return anything. Is called for the side effect of having the connection details stored.

See Also

retrieveConnectionDetails()

---

unlockKeyring *Helper function to unlock a keyring*

Description

This helper function is used to unlock a keyring by using the password stored in Sys.getenv("STRATEGUS_KEYRING_P
It will alert the user if the environment variable with the password is not set.

Usage

```
unlockKeyring(keyringName)
```

Arguments

keyringName	The name of the keyring to operate on. This function assumes you have created the keyring before calling this function. It defaults to NULL to select the default keyring. If the keyring is password protected, the password must be stored in the environment variable STRATEGUS_KEYRING_PASSWORD so it is retrieved using the command Sys.getenv("STRATEGUS_KEYRING_PASSWORD")

Value

Returns TRUE if the keyring was unlocked using the password otherwise it returns FALSE
